

Ongoing research towards state-of-the-art in variable and functional form selection for statistical models

Georg Heinze, Aris Perperoglou, Willi Sauerbrei
for TG2 of the STRATOS initiative

COMMENTARY

Open Access

State of the art in selection of variables and functional forms in multivariable analysis—outstanding issues

Willi Sauerbrei^{1*}, Aris Perperoglou², Matthias Schmid³, Michal Abrahamowicz⁴, Heiko Becher⁵, Harald Binder¹, Daniela Dunkler⁶, Frank E. Harrell Jr⁷, Patrick Royston⁸, Georg Heinze⁶ and for TG2 of the STRATOS initiative

Towards recommendations – research required!

1. Investigation and comparison of the properties of **variable selection strategies**
2. **Comparison of spline procedures** in univariable and multivariable contexts
3. How to model one or more variables with a **„spike-at-zero“**?
4. Comparison of **multivariable procedures for model and function selection**
5. **Role of shrinkage** to correct for bias introduced by data-dependent modelling
6. Evaluation of new approaches for **post-selection inference**
7. Adaptation of procedures for **very large sample sizes** needed?

Variable selection: current practice

- Various reviews of model building strategies identified univariate selection still in wide use
- (and its actual, silent use may be even much more widespread)

- TG2 is conducting a review of model building strategies in COVID-19 prediction models

Variable selection – poor guidance?

RESEARCH ARTICLE

Review of guidance papers on regression modeling in statistical series of medical journals

Christine Wallisch^{1,2*}, Paul Bach^{1,3}, Lorena Hafermann¹, Nadja Klein³, Willi Sauerbrei⁴, Ewout W. Steyerberg⁵, Georg Heinze², Geraldine Rauch^{1*}, on behalf of topic group 2 of the STRATOS initiative[¶]

Wallisch et al, 2022:

Selection of variables was mentioned in 15 series (65%) and described extensively in ten series (43%) (Fig 5). However, specific variable selection methods were rarely described in detail. *Backward elimination, selection based on background knowledge, forward selection, and stepwise selection* were the most frequently described selection methods in seven to eleven series (30–48%). *Univariate screening*, which is still popular in medical research, was only described in three series (13%) in up to one paragraph. Other aspects of variable selection were hardly ever mentioned. *Selection based on AIC/BIC*, relating to best subset selection or stepwise selection based on these information criteria, and the *choice of the significance level* were found in 2 series only (9%). Relative frequencies of aspects mentioned in articles are detailed in Figs 1–3 in [S5 File](#).

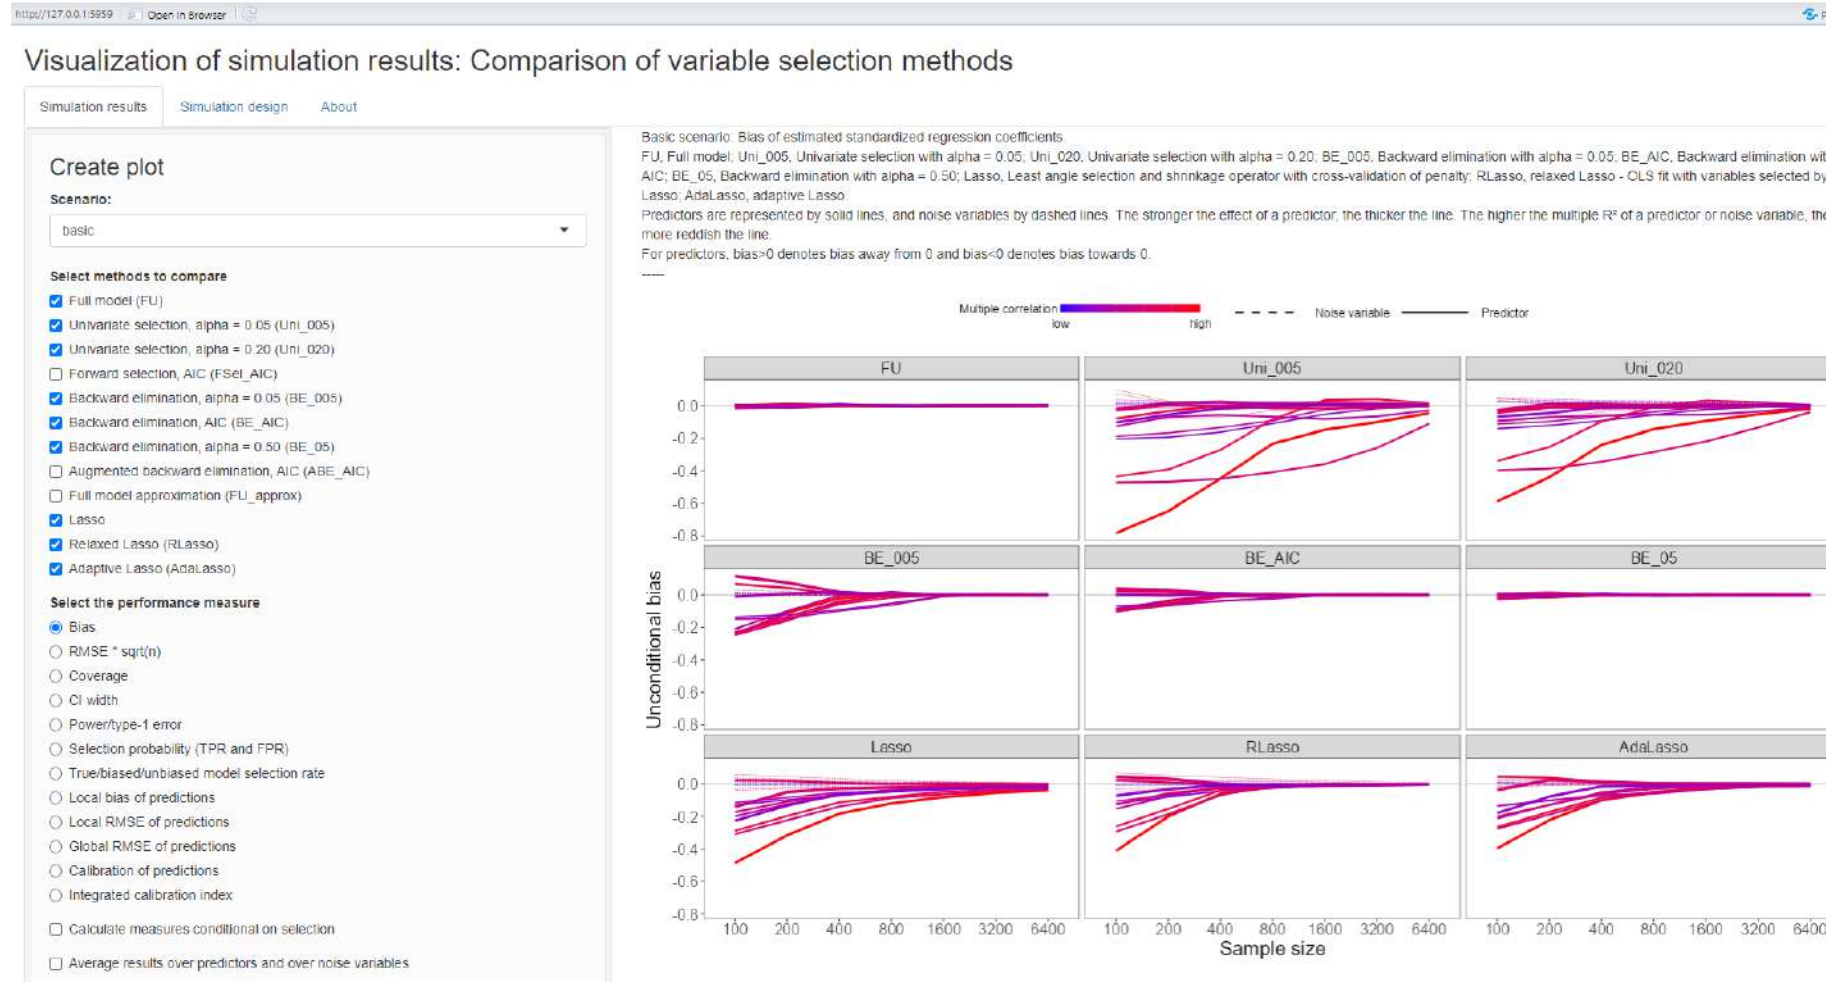

Fig 5. Extent of explanation of aspects of selection of variables in statistical series: One sentence only (light grey), more than one sentence to one paragraph (grey) and more than one paragraph (black).

Ongoing work

- Simulation studies:
 - Ullmann (Vienna)
 - Kipruto (Freiburg)
- Education:
 - TG2 workshops at ROeS 2021, Maastricht 2023
- Lectures and workshops by Willi Sauerbrei, Frank Harrell, Georg Heinze & Daniela Dunkler and others

Key messages about variable selection

- Purpose of model? Descriptive, explanatory, or predictive?
 - Large effects on coefficient estimates (simulation study by Th. Ullmann)
 - Smaller effects on predictions (see also Riley & Collins, BlomJ 2023: <https://doi.org/10.1002/bimj.202200302>)
- Relative performance of methods depends on sample size
- The true ,model‘ is rarely identified
- Inference is wrong – where does it matter?
- *Accept model uncertainty as another source of variation!*

The role of background knowledge

Some STRATOS-triggered cooperations (project SAMBA)

- Good examples for background knowledge:
Nottingham Prognostic Index (Breast Cancer)
Framingham risk score (Cardiovascular Med.)
- But: Poorly conducted studies generate background „knowledge“ that is of little use
- *Critically appraise the source of the background knowledge!*

Methodology

Spline procedures: current questions

- Which estimator is the ‚best‘?

Performance Measure Selector

Target:	Type of summation:
<input type="radio"/> Functional form	<input type="radio"/> Expectation
<input checked="" type="radio"/> Predictions	<input checked="" type="radio"/> Expectation over $dF(X)$
<input type="radio"/> Effect estimate of Intervention	<input type="radio"/> Expectation over precision of reference function
Localisation:	<input type="radio"/> Maximum
<input checked="" type="radio"/> Global	<input type="radio"/> Minimum
<input type="radio"/> Local	<input type="radio"/> Median
Loss:	
<input type="radio"/> Difference	
<input type="radio"/> Absolute	
<input checked="" type="radio"/> Squared	
<input type="radio"/> Epsilon-level accuracy	
Dimension:	
<input checked="" type="radio"/> Y	
<input type="radio"/> X	

→ Many different performance measures can be ‚designed‘ by combining different aspects

→ Which of them are suitable?

Currently: evaluation of performance measures

Next step: comparison of splines

Combining variable and functional form selection

- Several, philosophies':

	Multivariable fractional polynomials (mfp2)	Restricted cubic splines (rms)	Penalized/thin plate splines (mgcv)
Selection	Significance-based	No	Penalty-based
Smoothing	Global: x^{p_1}, x^{p_2}	Local: spline based	Local: spline based
Basis functions (4df)	2 per variable (FP2)	4 per variable	,many' per variable

Comparison in Pima data set:

- Predicting diabetes onset (yes/no) in 768 members of Pima nation
- 8 cont. predictors

4 selected (6 df)

(8 included, 32 df)

6 selected (11.2 edf)

- Partial linear predictors for BMI:

Role of shrinkage

STUDY PROTOCOL

Comparison of variable selection procedures and investigation of the role of shrinkage in linear regression-protocol of a simulation study in low-dimensional data

Edwin Kipruto *, Willi Sauerbrei

Institute of Medical Biometry and Statistics, Faculty of Medicine and Medical Center - University of Freiburg, Freiburg, Germany

* Edwin.Kipruto@imbi.uni-freiburg.de

PlosOne 2022

Talk by Edwin Kipruto @CEN 2023

A. Variable selection methods

Method	Tuning parameters	Initial estimates
Lasso	10-fold CV, AIC & BIC	N/A
Garrote	10-fold CV, AIC & BIC	OLS, ridge and lasso
Alasso*	10-fold CV, AIC & BIC	OLS, ridge and lasso
Rlasso*	10-fold CV, AIC & BIC	N/A
Best subset	10-fold CV, AIC & BIC	N/A
BE*	10-fold CV, AIC & BIC	N/A

B. Post-estimation shrinkage methods:

(i) Global [10], (ii) parameterwise [9] and (iii) Breiman's method [5]

Estimation method: (i) leave-one-out CV and (ii) 10-fold CV

Evaluation of selective inference STRATOS-triggered cooperation

- Phase II-III study
(Neutral,
rather new methods,
limited range of scenarios)
- Software still in its infancy
- Sel.Inf.-CI were proposed for fixed- λ LASSO
- They empirically work also with tuned λ , but are sometimes conservative
- They don't work well with Adaptive Lasso

Kammer et al.

RESEARCH

Open Access

Evaluating methods for Lasso selective inference in biomedical research: a comparative simulation study

Michael Kammer^{1,2}, Daniela Dunkler¹, Stefan Michiels³ and Georg Heinze^{1*}

Adaptation for big data sets

- Big data sets (many observations) make any p-values ridiculously small
- How to separate relevant from irrelevant effects?
- Model size depends on purpose of the model
 - Should the model be communicable or a ,black-box‘?
 - Can the model be applied electronically (e.g. on EHRs)?
 - Model approximation/projection?
- Ongoing project in the context of MFP
(Willi Sauerbrei, Patrick Royston, Aris Perperoglou)

STRATOS cooperations between TGs

- TG2-TG4: effects of measurement error on functional form estimation
Exciting design of an adversarial simulation study with distributed roles
data generator – data analysts – performance evaluator
- TG2-TG3: ‚Regression without regrets‘
 - Initial data analysis before regression analysisPaper to be submitted soon; previous talks at ISCB 2020, IBC 2022

Simulation studies – key instruments to compare approaches

Boulesteix et al, *Significance* 2020

There is a clear need for more neutral comparisons and replications of methodological statistical research, but how should such studies be performed? Surprisingly, the design of comparison studies of statistical methods has hardly been addressed

Heinze, Boulesteix, Kammer, Morris, White
(STRATOS Simulation Panel), *BiomJ* 2023:

Biostatistical methods are typically developed and evaluated in **four phases**; only after **Phase IV** we know when a method **is or is not the preferred method**
Each phase needs different type of simulation study

- Special issue in Biometrical Journal devoted to ‘Neutral Comparison Studies’ (to be released very soon)

Pawel et al, *BiomJ* 2023:

We show how easy it is to make the method appear superior over well-established competitor methods if no protocol is in place and various questionable research practices are employed

Statistics in Practice, CEN2023:

The image shows the cover of a report. At the top left are the logos for UKRI and the MRC Clinical Trials Unit. At the top right is the UCL logo. The title is 'Simulation studies as a tool to assess and compare the properties of statistical methods – an overview'. Below the title are the authors 'Tim Morris and Brennan Kahan' and their affiliation 'MRC Clinical Trials Unit at UCL'. At the bottom left are the email addresses 'tim.morris@ucl.ac.uk' and 'brennan.kahan@ucl.ac.uk'. At the bottom center is the text 'IBS CEN Statistics in Practice' and at the bottom right is the date '4 Sep 2023'. In the bottom right corner, there is a blue triangle containing the text 'Smarter Studies Global Impact Better Health'.

Conclusion

- In many areas, we have enough methods but we don't know yet which one to recommend/discourage from
- We need evidence generated in neutral comparison studies of Phases III and IV:
 - Simulation studies
 - Comparative studies based on real data sets with real scientific questions
- Which methods are ready to use:
 - by level-1 data analysts?
 - by level-2 statisticians?
